Rules for integrands of the form $P_q[x] (a + b x^2)^p$

1:
$$\left[P_q[x]\left(a+b\,x^2\right)^p dx \text{ when } p+2 \in \mathbb{Z}^+\right]$$

Derivation: Algebraic expansion

Rule 1.1.2.x.1: If
$$p + 2 \in \mathbb{Z}^+$$
, then

$$\int\! P_q\left[x\right]\,\left(a+b\,x^2\right)^p\,\text{d}x\ \rightarrow\ \int \text{ExpandIntegrand}\left[P_q\left[x\right]\,\left(a+b\,x^2\right)^p,\,x\right]\,\text{d}x$$

Program code:

2:
$$\left[P_q[x]\left(a+b\,x^2\right)^p dx \text{ when } P_q[x,\,\theta] == 0\right]$$

Derivation: Algebraic simplification

Rule 1.1.2.x.2: If
$$P_q[x, 0] = 0$$
, then

$$\int\!\!P_q\left[x\right]\,\left(a+b\,x^2\right)^p\,\text{d}x\;\to\;\int\!x\;\text{PolynomialQuotient}\left[P_q\left[x\right],\,x,\,x\right]\,\left(a+b\,x^2\right)^p\,\text{d}x$$

```
Int[Pq_*(a_+b_.*x_^2)^p_,x_Symbol] :=
   Int[x*PolynomialQuotient[Pq,x,x]*(a+b*x^2)^p,x] /;
FreeQ[{a,b,p},x] && PolyQ[Pq,x] && EqQ[Coeff[Pq,x,0],0] && Not[MatchQ[Pq,x^m_.*u_. /; IntegerQ[m]]]
```

3: $\left[P_q[x]\left(a+b\,x^2\right)^p\,\mathrm{d}x\right]$ when PolynomialRemainder $\left[P_q[x],a+b\,x^2,x\right]=0$

Derivation: Algebraic expansion

Rule: If PolynomialRemainder $[P_q[x], a + b x^2, x] = 0$, then

Program code:

$$Int[Px_*(a_+b_-*x_^2)^p_-,x_Symbol] := \\ Int[PolynomialQuotient[Px,a+b*x^2,x]*(a+b*x^2)^(p+1),x] /; \\ FreeQ[\{a,b,p\},x] && PolyQ[Px,x] && EqQ[PolynomialRemainder[Px,a+b*x^2,x],0] \\ \end{cases}$$

4. $\left[P_q[x](a+bx^2)^p dx \text{ when } p < -1\right]$

1:
$$\left[P_q \left[x^2 \right] \left(a + b \; x^2 \right)^p \, dx \right]$$
 when $p + \frac{1}{2} \in \mathbb{Z}^- \land 2 \; q + 2 \; p + 1 < 0$

Derivation: Algebraic expansion and binomial recurrence 3b

Basis:
$$\int (a + b x^2)^p dx = \frac{x (a+b x^2)^{p+1}}{a} - \frac{b (2 p+3)}{a} \int x^2 (a+b x^2)^p dx$$

Note: Interestingly this rule eleminates the constant term of $P_q[x^2]$ rather than the highest degree term.

2:
$$\int P_q[x] (a + b x^2)^p dx$$
 when $p < -1$

Derivation: Algebraic expansion and quadratic recurrence 2a

Rule 1.1.2.x.4.2: If p < -1,

5: $\int P_q[x] (a + b x^2)^p dx$ when $p \le -1$

Reference: G&R 2.160.3

Derivation: Trinomial recurrence 3a with A = 0, B = 1 and m = m - n

Reference: G&R 2.104

Note: This special case of the Ostrogradskiy-Hermite integration method reduces the degree of the polynomial in the resulting integrand.
